

Spatial cross-feeding: *Veillonella* (lactate consumer) is shallower than *S. oralis* (producer)

(c) Comparison with Welch 2016

Welch 2016 (PNAS)

CLASI-FISH, supragingival
Veillonella-Streptococcus
 “interdigitated” arrangement

This study (HOBIC FISH, $n = 10$)

Vei CoM shallower than *So*
 by $2.81 \mu\text{m}$ (mean,
 $p = 0.002$); 10/10 timepoints

Interpretation:

Vei above *So* (closer to bulk)
 → lactate diffuses upward
 → AGORA cross-feeding
 confirmed spatially
